Key words and phrases. Keyword1, Keyword2 .

1. DEFINITIONS

Definition of generalized Rascal triangle

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m} = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{k-m} \quad (1.1)$$

$$= \binom{n-k}{0} \binom{k}{0} + \binom{n-k}{1} \binom{k}{1} + \binom{n-k}{2} \binom{k}{2} + \dots + \binom{n-k}{i} \binom{k}{i} \quad (1.2)$$

Definition of $(1, q)$ -Pascal triangle

$$\begin{bmatrix} n \\ k \end{bmatrix}^q = \begin{cases} q & \text{if } k = 0, n = 0 \\ 1 & \text{if } k = 0 \\ 0 & \text{if } k > n \\ \begin{bmatrix} n-1 \\ k \end{bmatrix}^q + \begin{bmatrix} n-1 \\ k-1 \end{bmatrix}^q & \end{cases}$$

Pascals triangle as polynomial

$$\binom{n}{k} = \frac{(n)_k}{k!} = \frac{1}{k!} n(n-1)(n-2) \dots (n-(k-1)) = \prod_{i=1}^k \frac{n-i+1}{i} \quad (1.3)$$

2. FORMULAE

2.1. **Claim 0. Vandermonde convolution.** Generalized rascal number is partial case of Vandermonde convolution Consider Vandermonde convolution

$$\binom{a+b}{r} = \sum_{m=0}^r \binom{a}{m} \binom{b}{r-m}$$

Then generalized rascal number is partial case of Vandermonde convolution with upper summation bound equals i

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m} = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{k-m}$$

2.2. Claim 1. I-th column identity. Generalized rascal triangle equals to Pascal's triangle up to i -th column

$$\binom{n}{k}_i = \binom{n}{k}, \quad 0 \leq k \leq i \quad (2.1)$$

$$\binom{n}{i-j}_i = \binom{n}{i-j}, \quad \text{ColumnIdentity1} \quad (2.2)$$

$$\binom{n}{n-i+j}_i = \binom{n}{n-i+j}, \quad \text{ColumnIdentity2} \quad (2.3)$$

2.3. Claim 2. 2i+1 row identity. Generalized rascal triangle equals to Pascal's triangle up to $2i + 1$ -th row

$$\binom{n}{k}_i = \binom{n}{k}, \quad 0 \leq n \leq 2i + 1 \quad (2.4)$$

For every fixed $i \geq 0$

$$\binom{2i+1-j}{k}_i = \binom{2i+1-j}{k} \quad \text{RowIdentity1} \quad (2.5)$$

$$\binom{(2i+1)-j}{k}_{(2i+1)-i-1} = \binom{(2i+1)-j}{k} \quad (2.6)$$

For every fixed $i \geq 0$ and $t \geq 2i + 1$

$$\binom{t-j}{k}_{t-i-1} = \binom{t-j}{k} \quad \text{RowIdentity2} \quad (2.7)$$

For $k = j$

$$\binom{2i+1-j}{j}_i = \binom{2i+1-j}{j}, \quad 0 \leq j \leq i \quad \text{RowIdentity3}$$

$$\binom{2i+1-j}{2i+1-2j}_i = \binom{2i+1-j}{2i+1-2j}$$

$$\binom{(2i+1)-j}{(2i+1)-2j}_{(2i+1)-i-1} = \binom{(2i+1)-j}{(2i+1)-2j}$$

$$\binom{t-j}{t-2j}_{t-i-1} = \binom{t-j}{t-2j}, \quad t \geq 2i + 1, \quad 0 \leq j \leq t - i - 1, \quad \text{RowIdentity4}$$

2.4. Proof of 2i+1 row identity. Let be definition of rascal number

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m} = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{k-m}$$

Then for every $0 \leq n \leq 2i+1$ holds

$$\binom{n}{k}_i = \binom{n}{k}, \quad 0 \leq n \leq 2i+1 \quad (2.8)$$

Let be Vandermonde formula

$$\binom{a+b}{r} = \sum_{m=0}^r \binom{a}{m} \binom{b}{r-m}$$

By Vandermonde formula

$$\binom{n}{k} = \sum_{m=0}^k \binom{n-k}{m} \binom{k}{k-m}$$

Then for every $0 \leq n \leq 2i+1$ and $0 \leq k \leq 2i+1-n$

$$\binom{2i+1-n}{k}_i = \binom{2i+1-n}{k}$$

Thus we have to prove that

$$\begin{aligned} \binom{2i+1-n}{k}_i &= \sum_{m=0}^i \binom{2i+1-n-k}{m} \binom{k}{m} = \binom{2i+1-n}{k} \\ \binom{2i+1-n}{k} &= \sum_{m=0}^i \binom{2i+1-n-k}{m} \binom{k}{m} = \sum_{m=0}^k \binom{2i+1-n-k}{m} \binom{k}{k-m} \end{aligned}$$

Rewrite explicitly gives for i

$$\begin{aligned} \sum_{m=0}^i \binom{2i+1-n-k}{m} \binom{k}{m} &= \binom{2i+1-n-k}{0} \binom{k}{0} + \binom{2i+1-n-k}{1} \binom{k}{1} \\ &+ \binom{2i+1-n-k}{2} \binom{k}{2} + \binom{2i+1-n-k}{3} \binom{k}{3} \\ &+ \cdots + \binom{2i+1-n-k}{i} \binom{k}{i} \end{aligned}$$

Rewrite explicitly gives for k

$$\begin{aligned} \sum_{m=0}^k \binom{2i+1-n-k}{m} \binom{k}{m} &= \binom{2i+1-n-k}{0} \binom{k}{0} + \binom{2i+1-n-k}{1} \binom{k}{1} \\ &+ \binom{2i+1-n-k}{2} \binom{k}{2} + \binom{2i+1-n-k}{3} \binom{k}{3} \\ &+ \cdots + \binom{2i+1-n-k}{k} \binom{k}{k} \end{aligned}$$

We have three cases in general $k < i$, $k = i$, $k > i$, so we have to prove that

$$\sum_{m=0}^k \binom{2i+1-n-k}{m} \binom{k}{m} - \sum_{m=0}^i \binom{2i+1-n-k}{m} \binom{k}{m} = 0$$

For the case $k < i$ proof in Jenna et al paper. For the case $k = i$ proof is trivial. Thus,

$$\sum_{m=i+1}^k \binom{2i+1-n-k}{m} \binom{k}{m} = 0$$

Considering the constraints,

$$\begin{cases} n \geq 0 \\ k \geq i+1 \\ 2i+1-n-k \leq i-n \\ m \geq i+1 \end{cases}$$

Thus,

$$\sum_{m=i+1}^k \binom{2i+1-n-k}{m} \binom{k}{m} = 0$$

because binomial coefficients $\binom{i-n-s}{i+1+s}$ are zero for each $i, n, s \geq 0$.

2.5. **Claim 3. Row-column difference binomial identity.** Row-column difference identity. Proof via Vandermonde's identity. For every fixed $i \geq 1$

$$\begin{aligned} \binom{n+2i}{i} - \binom{n+2i}{i}_{i-1} &= \binom{n+i}{i} \quad \text{RowColumnDifferenceIdentity1} \\ \binom{n+2i}{n+i} - \binom{n+2i}{n+i}_{i-1} &= \binom{n+i}{n} \\ \binom{(n+i)+i}{(n+i)} - \binom{(n+i)+i}{(n+i)}_{i-1} &= \binom{(n+i)}{(n+i)-i} \\ \binom{j+i}{j} - \binom{j+i}{j}_{i-1} &= \binom{j}{j-i}, \quad \text{RowColumnDifferenceIdentity2} \end{aligned}$$

2.6. **Proof of Row-column difference binomial identity.** Let be Vandermonde formula

$$\binom{a+b}{r} = \sum_{m=0}^r \binom{a}{m} \binom{b}{r-m}$$

Let be definition of rascal number

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m}$$

Then

$$\begin{aligned} \binom{n+2i}{i} - \binom{n+2i}{i}_{i-1} &= \binom{n+i}{i} \\ \sum_{m=0}^i \binom{n+i}{m} \binom{i}{i-m} - \sum_{m=0}^{i-1} \binom{n+i}{m} \binom{i}{m} &= \binom{n+i}{i} \end{aligned}$$

2.7. **Difference between binomial coefficients and iterated rascal numbers.** For every $i < k$

$$\binom{n}{k} - \binom{n}{k}_i = \sum_{m=i+1}^k \binom{n-k}{m} \binom{k}{m}$$

2.8. **Claim 4.** Relation between $(1, q)$ -Pascal's triangle

$$\begin{aligned} \binom{2i+3+j}{i+2} - \binom{2i+3+j}{i+2}_i &= \left[\begin{matrix} i+2+j \\ i+2 \end{matrix} \right]^{i+2}, \quad \text{OneQPascalIdentity1} \\ \binom{2(i+2)-1+j}{i+2} - \binom{2(i+2)-1+j}{i+2}_i &= \left[\begin{matrix} i+2+j \\ i+2 \end{matrix} \right]^{i+2} \\ \binom{2t-1+j}{t} - \binom{2t-1+j}{t}_{t-2} &= \left[\begin{matrix} t+j \\ t \end{matrix} \right]^t, \quad \text{OneQPascalIdentity2} \end{aligned}$$

3. ROW SUMS POWER OF 2 IDENTITY

By definition

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m} \quad (3.1)$$

Consider Vandermonde convolution

$$\binom{a+b}{r} = \sum_{m=0}^r \binom{a}{m} \binom{b}{r-m}$$

Then generalized rascal number is partial case of Vandermonde convolution with upper summation bound equals i

$$\binom{n}{k}_i = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{m} = \sum_{m=0}^i \binom{n-k}{m} \binom{k}{k-m}$$

Difference between binomial coefficients and iterated rascal numbers

$$\binom{n}{k} - \binom{n}{k}_i = \sum_{m=i+1}^k \binom{n-k}{m} \binom{k}{k-m}$$

Proposition 3.1. Row $4i+3$ sum gives 2^{4i+2}

$$\sum_{k=0}^{4i+3} \binom{4i+3}{k}_i = 2^{4i+2}$$

$$\sum_{k=0}^{4i+3} \binom{4i+3}{k}_i = 2^{4i+2}$$

$$\sum_{k=0}^{4i+3} \binom{4i+3}{k}_i = \sum_{k=0}^{4i+3} \sum_{m=0}^i \binom{4i+3-k}{m} \binom{k}{m} = 2^{4i+2}$$

We know that sum of binomial coefficients equals 2^n

$$\sum_{k=0}^{4i+3} \binom{4i+3}{k} = 2^{4i+3}$$

If conjecture holds, then it must be true that

$$\sum_{k=0}^{4i+3} \binom{4i+3}{k} - \binom{4i+3}{k}_i = 2^{4i+2}$$

because $2^n - 2^n = 2^{n-1}$. Thus,

$$\sum_{k=0}^{4i+3} \sum_{m=i+1}^k \binom{4i+3-k}{m} \binom{k}{m} = 2^{4i+2}$$

In case $k < i$ the sum $\sum_{m=i+1}^k \binom{4i+3-k}{m}$ is always zero.

$$\sum_{k=i+1}^{4i+3} \sum_{m=i+1}^k \binom{4i+3-k}{m} \binom{k}{m} = 2^{4i+2}$$

$$\sum_{k=0}^{4i+3} \sum_{m=i+1}^k \binom{4i+3-(i+1+k)}{m} \binom{k}{m} = 2^{4i+2}$$

$$\sum_{k=0}^{3i+2} \sum_{m=i+1}^k \binom{3i+2-k}{m} \binom{k}{m} = 2^{4i+2}$$

$$\sum_{k=0}^{3i+2} \sum_{m=0}^k \binom{3i+2-k}{i+1+m} \binom{k}{i+1+m} = 2^{4i+2}$$

$$\sum_{k=0}^{3i+2} \sum_{m=0}^{3i+2-k} \binom{3i+2-k}{i+1+m} \binom{k}{i+1+m} = 2^{4i+2}$$

$$\sum_{k=0}^{3i+2} \sum_{m=0}^{3i+2-k} \binom{3i+2-k}{(3i+2-k)-(i+1+m)} \binom{k}{i+1+m} = 2^{4i+2}$$

$$\sum_{k=0}^{3i+2} \binom{3i+2}{3i+2-k} = 2^{4i+2}$$
